

## Anaerobic Digestion - Poo Power!

### Advanced Digestion

**Anaerobic Digestion** is the breakdown of **biodegradable** material when there is **NO OXYGEN**. This happens naturally when manure and food waste rot. An **Anaerobic Digester** speeds up this process and uses, the otherwise harmful, greenhouse gasses produced, to make **HEAT** and **ELECTRICITY**.

As all the products from this process can be used and there is no waste, it means it is **efficient** and **sustainable**.
